

Environmental & Conservation Position Summary

INVESTOR TIER 2 · ENVIRONMENTAL & CONSERVATION

Environmental & Conservation Position Summary

This document summarises SHER Sanctuary's environmental position, conservation commitments, and the ecological context of the Savannes Bay estate. It is a design-intent and project-position document — not an independently certified environmental assessment.

Not an environmental certification: This document is a position summary prepared by the SHER project team drawing on the SHER Design Charter (SHER-DNA-001-R02), planning documents, and site knowledge. It does not constitute a certified Environmental Impact Assessment (EIA), an SLNT opinion, or any regulatory authority approval. An EIA may be required as part of the DCA planning submission process.

1. Site Context — Savannes Bay

The SHER estate is located at Savannes Bay, Micoud, on the southern Atlantic coast of Saint Lucia, West Indies. The bay and its surrounding wetland are among the most ecologically significant coastal environments on the island:

- **RAMSAR designation** — Savannes Bay Wetlands are designated under the Ramsar Convention on Wetlands, recognising their international importance as a habitat for migratory birds, coastal fish nurseries, and mangrove ecosystem services;
- **Pointe Sable Environmental Protection Area (EPA)** — The estate lies within the Pointe Sable EPA, a protected coastal zone managed under Saint Lucia environmental legislation;
- **Scorpion Islet Marine Reserve** — The adjacent marine reserve protects the bay's reef and seagrass ecosystem. SHER's design and operational approach is required to avoid any impact on the marine environment;
- **Mangrove fringe** — A continuous mangrove fringe lines the bay edge. Mangroves are protected under Saint Lucia law and form part of SHER's conservation covenant boundary.

2. Conservation Land Allocation

204,148

Total estate (sq ft)
4.69 acres

95,374

Conservation zone (sq ft)
2.19 acres — 46.7% of estate

108,774

Developable area (sq ft)
2.50 acres

46.7% of the total estate area — approximately 2.19 acres — is designated as conservation land under SHER's conservation covenant. This zone encompasses the mangrove fringe, wetland buffer, bay edge, and conservation trail corridor. No residential or commercial construction is permitted within the conservation zone.

3. SHER's Six Conservation Design Pillars

The SHER Design Charter (SHER-DNA-001-R02) establishes six design pillars that govern every architectural and operational decision at SHER. Conservation performance is embedded at the foundational level — not added as an afterthought:

Pillar	Conservation Relevance
1. Preservation	Low-footprint foundations; raised construction to protect terrain and drainage; no clearing beyond the residential footprint; drainage contained and away from the conservation zone and bay
2. Wellness	Natural materials; clean indoor air; screened-glazed nature connection that does not require habitat disturbance to create the experience
3. Tranquillity	No vehicle dominance in guest areas; no audible mechanical noise at the conservation boundary; night-time calm maintained — controlled exterior lighting to prevent habitat spillover
4. Luxury	Premium-quality materials that weather authentically and require no synthetic treatments; durable maintenance regimes that do not introduce harmful chemicals near the wetland
5. Safety & Resilience	Hurricane-rated construction to minimise post-storm debris and damage; sealed buildings to exclude bats and insects without harmful treatments; wastewater management to prevent contamination
6. Rebirth & Identity	SHER's conservation ethic as a differentiator — a sanctuary that communicates renewal and connection to Saint Lucian nature rather than displacing it

4. Key Environmental Controls — Design Intent

LIGHTING • No floodlighting directed toward the conservation zone, mangrove fringe, or bay edge • All exterior fittings warm-toned (no blue-white LED) within 30m of the conservation boundary • Guest areas lit to comfort level only — no "resort floodlit" aesthetic • Designed to comply with any turtle-nesting and seabird protection requirements that may be specified by regulatory authorities	WILDLIFE & HABITAT • Sealed soffits and screened vents — no bat roosting cavities in any structure • No decorative features that create unintended roosting or nesting habitat in guest zones • All construction disturbance limited to the residential footprint and immediate service area • Native planting species preference in all landscape areas
DRAINAGE & WASTEWATER • No direct surface run-off to the conservation zone or bay edge • Contained drainage per plot confirmed by civil/environmental engineer • Wastewater treatment system designed to prevent any discharge to the wetland buffer or bay • Estate-wide water management plan to be prepared as part of DCA submission	SERVICE & MAINTENANCE • No chemical herbicide or pesticide use in conservation zone • Manual clearance only within 10m of the conservation boundary • All servicing, waste storage, and mechanical plant positioned on the service side of each building — away from guest and conservation sightlines

5. Conservation Covenant

SHER's conservation covenant is a design-intent commitment to maintaining the 46.7% conservation land allocation in perpetuity as part of the estate's DNA. The legal form and enforceability of the covenant will be confirmed in the full land title and conveyancing documentation available at Tier 3. The covenant's purpose is to provide permanent protection against future development encroachment on the conservation zone, regardless of changes in ownership.

6. EIA Requirements

An Environmental Impact Assessment (EIA) may be required as part of the DCA planning submission process, depending on the development's scale and the DCA's determination. SHER's project team is preparing for an EIA as part of the planning package. The EIA will be conducted by an independent environmental professional and will assess:

- Impact on the RAMSAR-designated wetland and its dependent species;
- Impact on the Pointe Sable EPA;
- Coastal and marine environment impacts;
- Construction-phase environmental management;
- Operational-phase waste, wastewater, and stormwater management;
- Mitigation measures and monitoring programme.

The outcome of the EIA process will be a material factor in the planning approval decision and may result in conditions attached to any planning permission granted.
