Project Brief: Materials & Conservation Covenant

This brief describes the structural and finish material strategy adopted across all SHER residences, and the legal and operational form of the conservation covenant that permanently protects 46.7% of the estate.

Section I — Approved Material Palette

SHER's material palette is governed by the SHER Sanctuary Design & Experience Charter (R02, Owner Approved 6 July 2026). The Charter's authority is absolute — no material may be introduced that conflicts with its design pillars or conservation controls. The palette below applies across all four residential typologies: Cottage Type A, Villa Type A, Condo Type A, and Flagship Villa Type B.

Primary Structural System

MARINE STEEL + TIMBER

MARINE-GRADE STEEL FRAME

The primary structural frame for all SHER residences. Hot-dip galvanised and coated with zinc-rich primer, marine epoxy, and UV-stable topcoat. Steel delivers the hurricane load path — continuous from roof to foundation — that the Saint Lucia wind zone requires. Bolted connections throughout; entirely inspectable and repairable without specialist plant.

Condo Type A uses a concealed I-beam steel primary frame, allowing maximum clear-span open-plan areas without visible structure in guest space.

TIMBER SECONDARY FRAME

Treated softwood or engineered timber secondary framing, decking, ceilings, and screens. Timber brings warmth, workability, and thermal comfort to the tropical climate. All timber is treated for durability; no synthetic treatments in occupied spaces or within the conservation zone.

Reclaimed timber joinery and selected feature elements are used for authenticity and to minimise embodied carbon at the detailing level.

Wall, Finish, and Roof Systems

STONE · LIME · METAL

Material	Application	Performance in Tropical Climate
Locally sourced volcanic stone	Base courses, wall panels, feature elements, steps, landscape edging	Authentic Saint Lucian materiality. Thermal mass — moderates indoor temperature naturally. No painting or surface treatment required. Indefinite durability.
Lime render (internal & external)	Wall finish coat, internal plaster, feature renders	Breathable — does not trap moisture behind the surface, preventing mould and rot in the humid tropical climate. Anti-microbial. Low embodied carbon. 1,000+ year structural track record. Compatible with stone and brick substrate.
Clay brick	Structural masonry where ground conditions favour masonry over steel, ornamental and garden masonry	Thermal mass, authentic regional character, excellent durability in tropical environments. Selected where steel frame is not the preferred structural approach at site level.

Material	Application	Performance in Tropical Climate
Standing-seam / concealed-fix metal roofing	Primary roof cladding on all typologies	Hurricane resilience — no exposed fasteners. Negative pressure under storm conditions cannot lift concealed-fix systems. Dark bronze, charcoal, or green-black tone; low heat-island contribution; long service life.
Reclaimed timber joinery	Feature doors, window frames, furniture-quality cabinetry, selected decking elements	Authenticity of material history. Zero additional embodied carbon. Selected pieces with verified provenance — not a wholesale structural material.

What SHER does not use: Hemp block, compressed earth, synthetic cladding or UPVC systems, exposed chemical preservatives in guest-occupied spaces, synthetic decking, floodlighting directed toward the conservation boundary, or any material requiring periodic chemical treatment in the conservation zone or within 10 metres of the conservation boundary.

Independent structural engineering certifications, detailed wall/roof/floor build-up specifications, and MEP documentation for all four product types are available at Tier 2 (SHER-INV-004-R01) and Tier 3. Professional structural engineer appointment and geotechnical survey will be completed as part of the DCA planning submission package.

Project Brief — Materials & Conservation Covenant

Section 2 — The Conservation Covenant

The conservation covenant is the most important single commitment Safeport Security Services Limited makes in relation to the SHER estate. It is distinct from, and more protective than, the statutory requirements that apply to the Savannes Bay area.

The Covenant in Plain Terms

95,374 sq ft (2.19 acres) — the conservation portion of Lot 905 — will never be offered for residential, commercial, hospitality, or any other form of built development. This is not a planning condition. It is not a requirement of the Development Control Authority, the Saint Lucia National Trust, or any other regulatory body. It is a unilateral corporate commitment made by Safeport Security Services Limited as a statement of conservation discipline.

The covenant is designed to be permanent. It is not conditional on market conditions, project ownership changes, future planning permissions, or investor preferences. It is not subject to variation by a future purchaser of a SHER residence.

WHAT THE COVENANT COVERS

- No residential buildings of any kind
- No commercial or hospitality buildings
- No access roads, carparks, or hard-standing
- No permanent utility infrastructure on or above the surface
- No clearing of vegetation beyond light maintenance
- No chemical treatment within the conservation zone
- No lighting directed toward the wetland edge
- No permanent boat infrastructure

WHAT THE COVENANT PERMITS

- Raised timber boardwalk (conservation trail) — no concrete footings
- Manual vegetation maintenance by estate staff
- Ecological survey and monitoring access
- SLNT-authorised conservation activities
- Kayak launch from the approved launch point at Parcel 12/13
- Educational access (groups by appointment, conservation-audited)

The legal form of the covenant — including its enforceability mechanism, binding nature on future owners, and the legal opinion on its permanence under Saint Lucia law — is documented in full at Tier 3 following NDA execution.

Section 3 — RAMSAR Context

Savannes Bay Wetlands were designated under the Ramsar Convention on Wetlands in 2002. The Convention designation is internationally binding — it is not a local planning classification and cannot be removed by Saint Lucia's own authorities without international process. The Ramsar designation recognises the bay as:

- **Internationally important migratory bird habitat** — seasonal use by species that use the Caribbean flyway;
- **Coastal fish nursery** — the mangrove system supports the juvenile stage of commercially and ecologically significant marine species;
- **Mangrove ecosystem services** — coastal protection, carbon sequestration, water filtration, shoreline stabilisation.

The Pointe Sable Environmental Protection Area (1,038 hectares) provides complementary statutory protection at the national level under Saint Lucia legislation. The Scorpion Islet Marine Reserve protects the bay's reef and seagrass ecosystem. Together, these three statutory frameworks create a protective context that no competitor could replicate on the southern Saint Lucia coastline.

National statutory protection

Scorpion Islet

Marine Reserve

Reef and seagrass protection

SHER's covenant exceeds the minimum: The statutory frameworks require specific behaviour within their defined zones. SHER's voluntary conservation covenant applies to land that is not necessarily within the statutory boundary — it is a self-imposed extension of the protection regime, applied to the estate's own land, permanently.

Project Brief — Materials & Conservation Covenant

Section 4 — Design Controls

The SHER Sanctuary Design & Experience Charter (R02) is the governing document for all design and operational decisions on the estate. The following controls derive from the Charter and apply permanently — they are not project-phase guidelines. They are estate laws.

Control	Scope	Standard
Lighting	All exterior fittings within 30m of the conservation boundary	Warm tone only (no blue-white LED). No floodlighting directed toward the conservation zone, mangrove fringe, or bay edge. Illuminance at conservation boundary: zero or ambient only. Design to comply with any turtle-nesting or seabird protection requirements.
Noise	All operational sound at or above the conservation boundary	No audible mechanical plant noise at the conservation boundary at any time. Generator and HVAC plant positioned on the service side of each building — away from conservation sightlines and the bay edge.
Utility infrastructure	All visible external infrastructure on the estate	No exposed utility infrastructure in guest or resident sightlines. All solar, wastewater, and storage infrastructure positioned at Lot 890 or on the service side of each residence. No above-ground cables or pipes in the guest experience zone.
Single-use plastic	Estate-wide — all operations and residences	Zero single-use plastic policy across the estate. Applies to SHER operations, hospitality service, and any third-party service providers operating on the estate. Not negotiable.
Scorpion Islet access	All kayak operations originating from SHER	One landing per day on Scorpion Islet — regardless of booking demand. Non-negotiable operational limit. This limit is a conservation decision by SHER, not a regulatory requirement. It may be tightened if ecological monitoring indicates stress on nesting habitat.
Chemical use	All maintenance within 10m of the conservation boundary	No chemical herbicide, pesticide, or synthetic fertiliser within 10 metres of the conservation boundary. Manual clearance only. No chemical run-off toward the wetland buffer.
Bat exclusion	All residential and hospitality structures	Sealed soffits and screened vents at all structures — no bat roosting cavities. No decorative architectural features that create unintended roosting or nesting habitat in guest-occupied zones.

Enforcement: The design controls are embedded in the SHER Design Charter, which is incorporated by reference into all resident purchase agreements and the estate's operational management framework. They are not aspirational — they are contractual. Any operator, contractor, or guest who violates a design control is in breach of estate rules, which carry defined consequences up to and including loss of access rights.
